

TOTAL

TOTAL OIL ASIA PTE LTD
Company No : 198203852R

Our Quality Certification to All Our Customers.

Base oils are manufactured in lube oil plants, in reality, a small-scale version of a crude oil refinery consisting of several different process units: i.e., distillation, deasphalting, dearomatization, dewaxing and hydrogenation. The latter yields the so-called hydrocrack base oils widely used in our formulations. These are costly infrastructures, and TOTAL is one of the few internationally renowned oil companies to have such facilities.

It takes a dynamic and ongoing Research and Development policy to produce lubricants that meet and exceed user performance requirements while at the same time respecting the environment. In order to achieve all these, we only use virgin base oils of the finest quality for all our lubricants. Absolutely no recycled or reprocessed base oils. We do not compromise in quality, that's our hallmark. We do not even contemplate using any other base oils coming from other sources which have not passed our stringent laboratory tests.

Our assurance to you also comes from our dedicated research facilities in Solaize, Southeast of France, specialist engineers and formulators, our ongoing relations with strategic OEM partners and importantly our absolute resolved in caring for the environment. Every golden drop of our premium lubricant coming out from our packaging is nothing short of the best in quality and performance. So that you have perfect ease in mind when it is working hard in your machines or vehicles.

Yours faithfully,

KC Foo
